

## Mawlana Bhashani Science And Technology University

# Lab-Report

Report No : 11

Course Code : ICT-3110

Course Title : Operating System Lab.

Date of Performance :

Date of Submission : 29/09/2020

### Submitted By:

Name: Md Abdur Rahim

ID: IT-18024

3<sup>rd</sup> Year 1<sup>st</sup> Semester

Session : 2017-18

Dept. of ICT

MBSTU

### Submitted To:

Nazrul Islam

Assistant Professor

Dept. of ICT

MBSTU

## Experiment No : 11

**Experiment Name :** Implementation of FIFO page replacement Algorithm.

**FIFO page replacement Algorithm :**

- 01.Round Robin is the preemptive process scheduling algorithm
- 02.Each process is provided a fix time to execute, it is called a quantum.
- 03.Once a process is execute for a given time period, it is preempted and other process executes for a given time period.

### Algorithm:

- Start the program
- Read the number of frames
- Read the number of pages
- Read the page numbers
- Initialize the values in frames to -1
- Allocate the pages in to frames in First in first out order.
- Display the number of page faults.

### Code Implementation:

```
#include<stdio.h>

int main()

{

int reference_string[10],page_hits=0, page_faults = 0;
```

```
int temp[10],m, n, s, pages, frames;

clrscr();

printf("\n\n\t\t\t*****One Day Engineer*****\n\n");

printf("\nEnter Total Number of Pages:\t");

scanf("%d", &pages);

printf("\nEnter values of Reference String:\n");

for(m = 0; m < pages; m++)

{

printf("Value No. [%d]:\t", m + 1);

scanf("%d", &reference_string[m]);

}

printf("\nEnter Total Number of Frames:\t");

scanf("%d", &frames);

for(m = 0; m < frames; m++)

temp[m] = -1;

for(m = 0; m < pages; m++)

{

s = 0;

for(n = 0; n < frames; n++)
```

```
{  
  
if(reference_string[m] == temp[n])  
  
{  
  
s++;  
  
page_hits++;  
  
page_faults--;  
  
}  
  
}  
  
page_faults++;  
  
if((page_faults <= frames) && (s == 0))  
  
{  
  
temp[m] = reference_string[m];  
  
}  
  
else if(s == 0)  
  
{  
  
temp[(page_faults - 1) % frames] = reference_string[m];  
  
}  
  
printf("\n");  
  
for(n = 0; n < frames; n++)  
  
printf("%d\t", temp[n]);
```

```

}

printf("\nTotal Page Faults:\t%d\n", page_faults);

printf("\n Total Page Hits:=\t%d\n",page_hits);

getch();

return 0;

}

```

## Output:

---

```

Enter values of Reference String:

```

```

Value No. [1]: 2
Value No. [2]: 3
Value No. [3]: 4
Value No. [4]: 2
Value No. [5]: 5
Value No. [6]: 6
Value No. [7]: 8
Value No. [8]: 3

```

```

Enter Total Number of Frames: 3

```

```

2      -1      -1
2      3      -1
2      3      4
2      3      4
5      3      4
5      6      4
5      6      8
3      6      8
Total Page Faults:      7
Total Page Hits:=      1

```

**Discussion:**

This is the simplest replacement algorithm. In this algorithm, the operating system keeps track of all pages in the memory in a queue, the older page is in the front of the queue
